

Energy Harvesting (EH) Multi-Source Demo Board with Transducers

DESCRIPTION

The DC2080 is a versatile energy harvesting demo board that is capable of accepting piezoelectric, solar, 4mA to 20mA loops, thermal powered energy sources or any high impedance AC or DC source. The board contains four independent circuits consisting of the following EH ICs:

- LTC®3588-1: Piezoelectric Energy Harvesting Power Supply
- LTC3108: Ultralow Voltage Step-Up Converter and Power Manager
- LTC3105: Step-Up DC/DC Converter with Power Point Control and LDO Regulator
- LTC3459: 10V Micropower Synchronous Boost Converter
- LTC2935-2 and LTC2935-4: Ultralow Power Supervisor with Power-Fail Output Selectable Thresholds

The board is designed to connect to the Energy Micro STK development kit. It also includes two energy harvester

transducers (TEG and Solar) and a terminal block for connecting a high impedance AC source.

In addition, many turrets are provided, making it easy to connect additional transducers to the board.

The board contains multiple jumpers that allow the board to be configured in various ways. The standard build for the board has 4 jumpers installed out of the possible 12 jumpers. The board is very customizable to the end users' needs. This compatibility makes it a perfect evaluation tool for any low power energy harvesting system.

Please refer to the individual data sheets for the operation of each power management circuit. The application section of this demo manual describes the system level functionality of this board and the various ways it can be used in early design prototyping.

Design files for this circuit board are available at <http://www.linear.com/demo/DC2080A>

dc2080af

QUICK START PROCEDURE

Refer to Figures 2, 3 and 4 for the proper equipment setup and jumper settings for the following quick start procedure.

1. Configure the equipment and jumpers as shown in Figure 2. Verify the jumper settings are as follows:

JP1 OPEN
JP2 OPEN
JP3 OPEN
JP4 OPEN
JP5 OPEN
JP6 OPEN
JP7 OPEN
JP8 **OPEN**
JP9 **INSTALLED in "ON" Position**
JP10 OPEN
JP11 OPEN
JP12 **INSTALLED**

2. Slowly increase PS1 and observe the voltage at which VM2 turns on. VM1 should be equal to approximately 3.15V.
3. Slowly decrease PS1 towards zero. Observe the voltage on VM1 at which VM2 drops rapidly to 0V. VM1 should be equal to approximately 2.25V.
4. Turn off PS1 and remove all test equipment.
5. **Install JP4** and connect the Energy Micro starter kit board to J1.
6. Apply a light source and observe the starter kit turning on and displaying the temperature of the microcontroller.
7. **MOVE JP4 to JP2** and place a warm object, such as your hand, firmly on the entire TEG1, thermal electric generator.
8. Observe the starter kit turning on and displaying the temperature of the microcontroller.

9. **MOVE JP4 to JP1.** Disconnect the Energy Micro starter kit from J1.
10. Set PS2 equal to 6.0V. Reconfigure the test equipment as shown in Figure 3.
11. Turn on PS2. Observe the voltage on VM1 and VM2. The voltage on VM1 should be approximately 5.77 Volts and on VM2 should be 3.3V.
12. Use VM3 to observe the voltage on JP5-2. The voltage should be equal to the same level observed on VM2.
13. Turn off PS2
14. **MOVE JP1 to JP3.** Disconnect PS2 from the board and set PS3 equal to 5.0V. Reconfigure the test equipment as shown in Figure 4.
15. Turn on PS3. Observe the voltage on VM1 and VM2. The voltage on VM1 should be approximately 0.34 Volts and on VM2 should be 3.3V.
16. Use VM3 to observe the voltage on JP7-2. The voltage should be approximately equal to the level observed on VM2.
17. Turn off PS3
18. Reset the Jumpers as shown in Figure 5a.

APPLICATION

Jumper Functions

JP1: Power selection jumper used to select the LTC3588-1, Piezoelectric Energy Harvesting Power Supply.

JP2: Power selection jumper used to select the LTC3108, TEG Powered Energy Harvester.

JP3: Power selection jumper used to select the LTC3105, powered by a diode voltage drop in a 4mA to 20mA loop.

JP4: Power selection jumper used to select the LTC3459, powered by a solar panel.

JP5: Routes the LTC3588-1 PGOOD signal to the Dust header PGOOD output. The LTC3588-1 PGOOD comparator produces a logic high referenced to V_{OUT} on the PGOOD pin the first time the converter reaches the sleep threshold of the programmed V_{OUT} , signaling that the output is in regulation. The PGOOD pin will remain high until V_{OUT} falls to 92% of the desired regulation voltage. Additionally, if PGOOD is high and V_{IN} falls below the UVLO falling threshold, PGOOD will remain high until V_{OUT} falls to 92% of the desired regulation point. This allows output energy to be used even if the input is lost.

JP6: Routes the LTC3108 PGOOD signal to the header PGOOD output.

JP7: Routes the LTC3105 PGOOD signal to the header PGOOD output.

JP8: Routes the LTC3459 PGOOD signal to the header PGOOD output.

JP9: Connects the fifteen optional energy storage capacitors directly to V_{OUT} to be used by the load to store energy at the output voltage level. The 100 μ F capacitors have a voltage coefficient of 0.61 of their labeled value at 3.3V and 0.47V at 5.25V. **CAUTION: Only JP9 OR JP10 may be connected at any one time. Do not populate both JP9 and JP10.**

JP10: Connects the fifteen optional energy storage capacitors directly to VSTORE of the LTC3108 TEG powered energy harvester circuit, which is the output for the storage capacitor or battery. A large capacitor may be connected from VSTORE to GND for powering the system in the event the input voltage is lost. It will be charged up to the maximum VAUX clamp voltage, typically 5.25 Volts. The 100 μ F capacitors have a voltage coefficient of 0.47V at 5.25V. **CAUTION: Only JP9 OR JP10 may be connected at any one time. Do not populate both JP9 and JP10.**

JP11: Configures the AC input for use with a PMDM vibration harvester, **CAUTION: Only JP11 OR JP12 may be connected at any one time. Do not populate both JP11 and JP12.**

JP12: Configures the AC input for use with any high impedance source including piezoelectric transducers, electromechanical transducers or AC mains supplies with high series resistance. **CAUTION: Only JP11 OR JP12 may be connected at any one time. Do not populate both JP11 and JP12.**

APPLICATION

Turret Functions

PZ1 (E1): Input connection for piezoelectric element or other AC source (used in conjunction with PZ2). A high impedance DC source may be applied between this pin and BGND to power the LTC3588-1 circuit. **CAUTION: The maximum current into this pin is 50mA.**

PZ2 (E2): Input connection for piezoelectric element or other AC source (used in conjunction with PZ1). A high impedance DC source may be applied between this pin and BGND to power the LTC3588-1 circuit. **CAUTION: The maximum current into this pin is 50mA.**

VIN, 20mV to 400mV (E3): Input to the LTC3108, TEG powered Energy Harvester. The input impedance of the LTC3108 power circuit is approximately 3Ω , so the source impedance of the TEG should be less than 10Ω to have good power transfer. TEG's with approximately 3Ω will have the best power transfer. The input voltage range is 20mV to 400mV.

BGND (E4,E6,E8,E11,E14): This is the board ground. BGND is connected to all the circuits on the board except the headers. BGND and HGND, the header ground are connected through Q3 when the VMCU voltage with respect to BGND reaches the rising RESET Threshold of U2 and disconnected when VMCU falls to the falling reset threshold. The board is configured from the factory to connect BGND and HGND when VMCU equals 3.15V and disconnect them when VMCU equals 2.25V.

+VIN, 4mA to 20mA LOOP (E5): Input to the LTC3105 supplied by a diode voltage drop. The current into this terminal must be limited to between 4mA and 20mA. The current into this turret flows through diode D1 to generate the diode voltage drop and into the LTC3105 power management circuit.

VIN SOLAR (E7): Input to the LTC3459, solar powered circuit with maximum power point control, provided by the LTC2935-4. The input regulation point for the MPPC function is 1.73V. The input range is 1.72V to 3.3V.

HGND (E9,E13): This is the header ground. HGND is the switched ground to the header that ensures the load is presented with a quickly rising voltage. BGND and HGND are connected through Q3 when the VMCU voltage with respect to BGND reaches the rising RESET Threshold of U2 and disconnected when VMCU falls to the falling reset threshold. The board is configured from the factory to connect BGND and HGND when VMCU equals 3.15V and disconnect them when VMCU equals 2.25 Volts.

VMCU (E10,E12): Regulated output of all the active energy harvester power management circuits, referenced to BGND. When VMCU is referenced to HGND it is a switched output that is passed through header, J1 to power the load.

APPLICATION

LTC3588-1: Piezoelectric Energy Harvesting Power Supply (Vibration or High-Impedance AC Source)

The LTC3588-1 piezoelectric energy harvesting power supply is selected by installing the power selection jumper JP1. The PGOOD signal can be routed to the header by installing jumper JP5.

If the application requires a wide hysteresis window for the PGOOD signal, the board has the provision to use the independent PGOOD signal, shown in Figure 10, generated by the LTC2935-2 and available on JP8. This signal is labeled as the PGOOD signal for the LTC3459 circuit (PGOOD_LTC3459), because the LTC3459 does not have its own PGOOD output. The PGOOD_LTC3459 signal can be used in place of any of the PGOOD signals generated by the harvester circuits. The board is configured from the factory to use the PGOOD_LTC3459 signal as the PGOOD signal to switch from battery power to energy harvesting power.

The PGOOD_LTC3459 signal is always used to switch the output voltage on the header. Some loads do not like to see a slowly rising input voltage. Switch Q3 ensures that VMCU on the header is off until the energy harvested output voltage is high enough to power the load. The LTC2935-2 is configured to turn on Q3 at 3.15V and turn off Q3 at 2.25V. With this circuit, the load will see a fast voltage rise at startup and be able to utilize all the energy stored in the output capacitors between the 3.15V and 2.25V levels.

The optional components R1, R4, Q1 and C5 shown on the schematic are not populated for a standard assembly. The function of R1, R4, Q1 and C5 is to generate a short PGOOD pulse that will indicate when the output capacitor is charged to its maximum value. The short pulse occurs every time the output capacitor charges up to the output sleep threshold, which for a 3.3V output is 3.312V. By populating these components the application can use this short pulse as a sequence timer to step through the

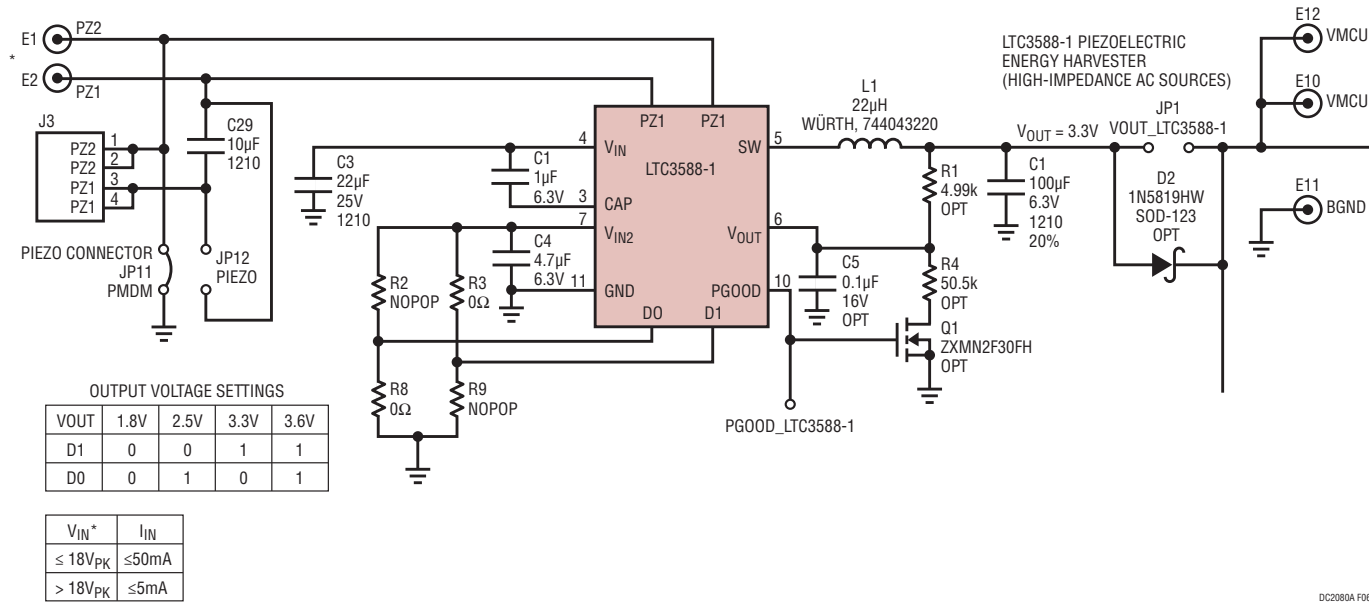

Figure 6. Detailed Schematic of LTC3588-1 Piezoelectric Energy Harvesting Power Supply

APPLICATION

program sequence or as an indication of when it can perform energy-intensive functions, such as a sensor read or a wireless transmission and/or receive, knowing precisely how much charge is available in the output capacitors. When this optional circuit is not used, the amount of charge in the output capacitors is anywhere between the maximum ($C_{OUT} \cdot V_{OUT_SLEEP}$) to eight per cent low. In the case where the energy harvesting source can support the average load continuously, this optional circuit is not needed.

Diode D2 is an optional component used to diode-OR multiple energy harvesting sources together. This diode would be used in conjunction with one or more of the other Or-ing diodes, D3, D4 or D5. When the Or-ing diodes are installed the parallel jumper would not be populated. The diode drop will be subtracted from the output voltage regulation point, so it is recommended to change the feedback resistors or select a higher output voltage

setpoint to compensate for the diode drop. When more than one of these diodes is installed and the associated energy harvester inputs are powered, the board will switch between energy harvester power circuits as needed to maintain the output voltage.

LTC3108: TEG Powered Energy Harvester

The LTC3108 TEG powered energy harvester is selected by installing the power selection jumper JP2. The PGOOD signal, PGOOD_LTC3108 can be routed to the header by installing Jumper JP6. The LTC3108 PGOOD signal is pulled up to the on-chip 2.2V LDO through a 1MΩ pull-up resistor.

If the application requires a wide hysteresis window for the PGOOD signal, please refer to the above section for a complete operational description of and how to use the independent PGOOD signal (PGOOD_LTC3459), shown in Figure 10, generated by the LTC2935-2 and available on JP8.

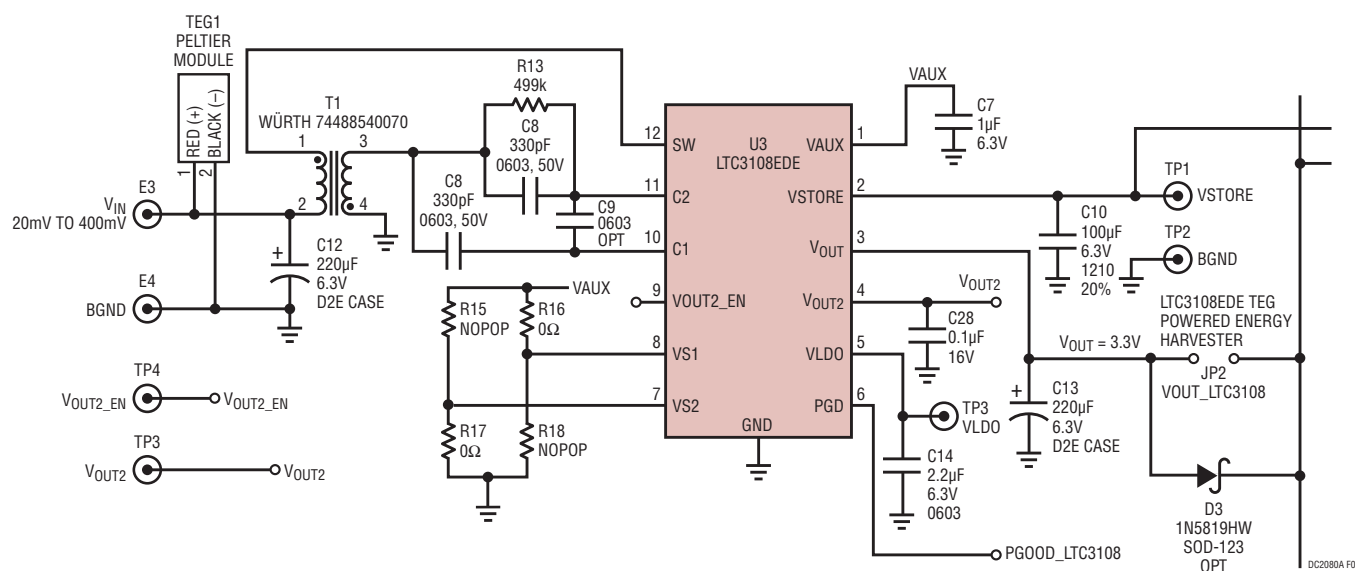

Figure 7. Detailed Schematic of LTC3108 TEG Powered Energy Harvester

APPLICATION

The PGOOD_LTC3459 signal is always used to switch the output voltage on the header. Some loads do not like to see a slowly rising input voltage. Switch Q3 ensures that VMCU on the header is off until the energy harvested output voltage is high enough to power the load.

When the PGOOD signal from the LTC3108 is used as the header signal, the setpoint for the LTC2935-2 circuit needs to be changed so the turn-on threshold is below the PGOOD_LTC3108 turn-on threshold of 3.053V. For example, by changing R36 to a 0Ω Jumper and R5 to NOPOP, the turn-on threshold for Q3 will be 2.99V rising and 2.25V falling.

Diode D3 is an optional component used to diode-OR multiple energy harvesting sources together. This diode would be used in conjunction with one or more of the other Or-ing diodes, D2, D4 or D5. When the Or-ing diodes are installed the parallel jumper would not be populated. The diode drop will be subtracted from the output voltage setpoint, so it is recommended to change the feedback resistors or select a higher output voltage setpoint to compensate for the diode drop. When more than one of these diodes is installed and the associated energy harvester inputs are powered, the board will switch between energy harvester power circuits as needed to maintain the output voltage.

LTC3105: Supplied By Diode Voltage Drop In 4mA to 20mA Loop

The LTC3105 4-20mA Loop, Diode Voltage Drop powered energy harvester is selected by installing the power selection jumper JP3. The PGOOD signal, PGOOD_LTC3105 can be routed to the Header by installing Jumper JP7. The PGOOD_LTC3105 signal is an open-drain output. The pull-down is disabled at the beginning of the first sleep event after the output voltage has risen above 90% of its regulation value. PGOOD_LTC3105 remains asserted until V_{OUT} drops below 90% of its regulation value at which point PGOOD_LTC3105 will pull low. The pull-down is also disabled while the IC is in shutdown or start-up mode.

If the application would benefit from a wider PGOOD hysteresis window than the LTC3105 provides (sleep to V_{OUT} minus 10%), the PGOOD_LTC3459 signal can be used in place of any of the PGOOD signals generated by the harvester circuits.

The PGOOD_LTC3459 signal is always used to switch the output voltage on the header. Some loads do not like to see a slowly rising input voltage. Switch Q3 ensures that VMCU on the header is off until the energy harvested output voltage is high enough to power the load.

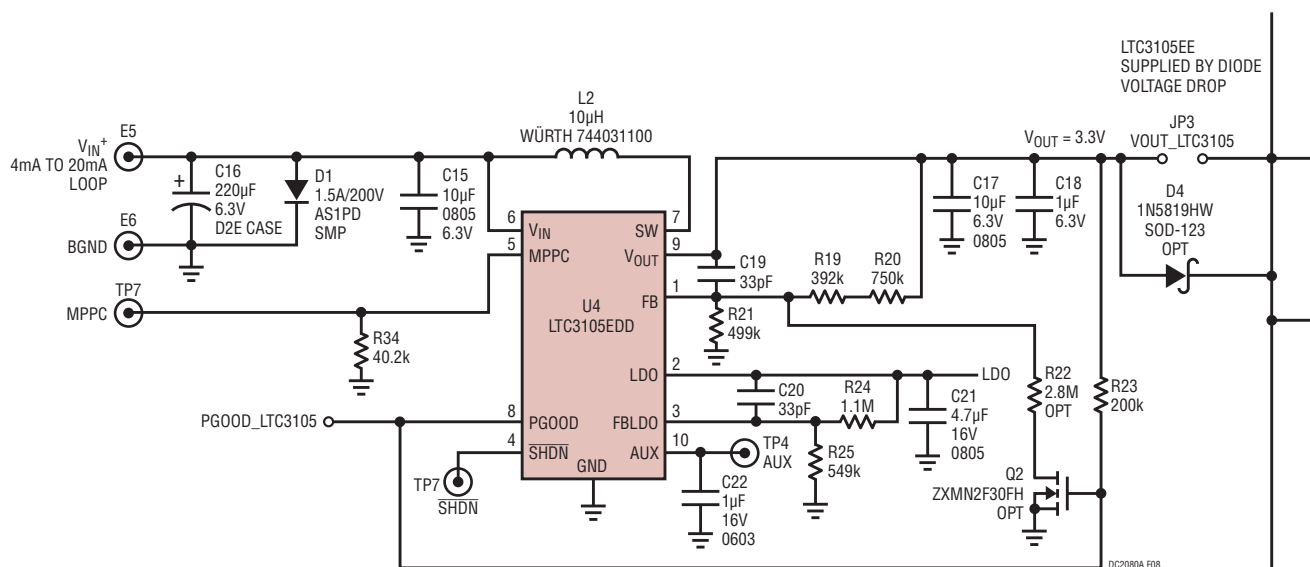

Figure 8. Detailed Schematic of LTC3105 4mA to 20mA Loop, Diode Voltage Drop Energy Harvester

APPLICATION

The optional components shown on the schematic are not populated for a standard assembly. The function of R22 and Q2 is to generate a short PGOOD pulse that will indicate when the output capacitor is charged to its maximum value. The short pulse occurs every time the output capacitor charges up to the output sleep threshold, which for a 3.3V output is 3.312V. By populating these components the application can use this short pulse as a sequence timer to step through the program sequence or as an indication of when it can perform energy intensive functions, such as a sensor read or a wireless transmission and/or receive, knowing precisely how much charge is available in the output capacitors. When this optional circuit is not used, the amount of charge in the output capacitors is anywhere between the maximum ($C_{OUT} \cdot V_{OUT_SLEEP}$) to ten percent low. In the case where the energy harvesting source can support the average load continuously, this optional circuit is not needed.

Diode D4 is an optional component used to Diode-OR multiple energy harvesting sources together. This diode would be used in conjunction with one or more of the other Or-ing diodes, D2, D3 or D5. When the Or-ing diodes are installed the parallel jumper would not be populated. The diode drop will be subtracted from the output voltage setpoint so it is recommended to change the feedback resistors

or select a higher output voltage setpoint to compensate for the diode drop. When more than one of these diodes is installed and the associated energy harvester inputs are powered, the board will switch between energy harvester power circuits as needed to maintain the output voltage.

LTC3459 Supplied By Solar Cell

The LTC3459 solar powered energy harvester is selected by installing the power selection jumper JP4. The PGOOD signal, PGOOD_LTC3459 can be routed to the Header by installing Jumper JP8.

The LTC2935-4 adds a hysteretic input-voltage regulation function to the LTC3459 application circuit. The PFO output of the LTC2935-4 is connected to the SHDN input on the LTC3459, which means that the LTC3459 will be off until VIN_LTC3459 rises above 1.743V ($1.72V + 2.5\%$) and will then turn off when VIN_LTC3459 falls below 1.72V. The result is that the input voltage to the LTC3459 circuit will be regulated to, 1.73V, the average of the LTC2934-4 rising and falling PFO thresholds. The threshold can be adjusted for the peak operating point of the solar panel selected. In this design, because the LTC3459 output is set to 3.3V and is a boost topology, the input voltage is limited to 3.3V.

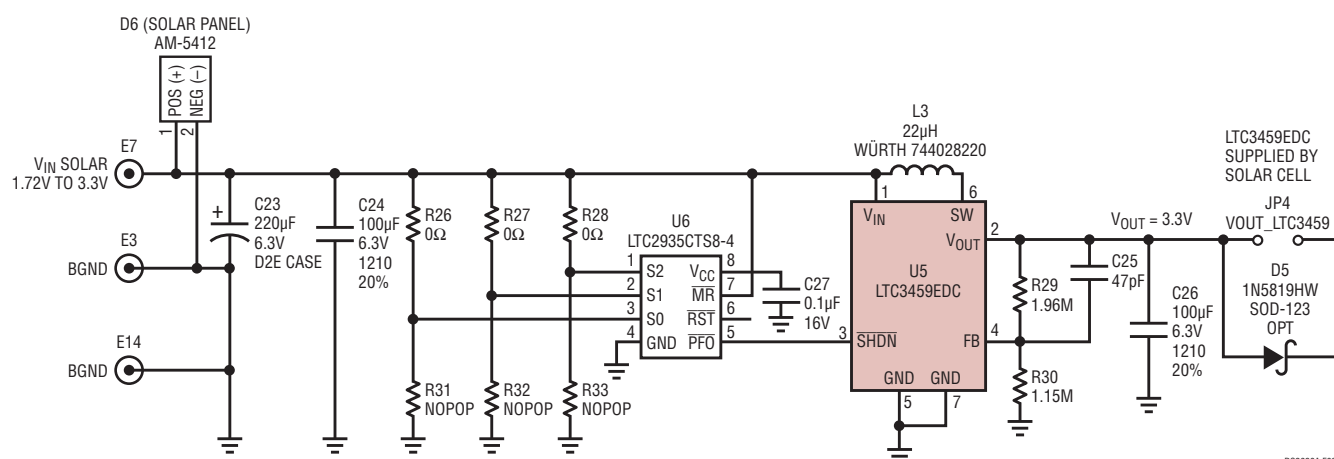

Figure 9. Detailed Schematic of LTC3459 Supplied by a Solar Cell

APPLICATION

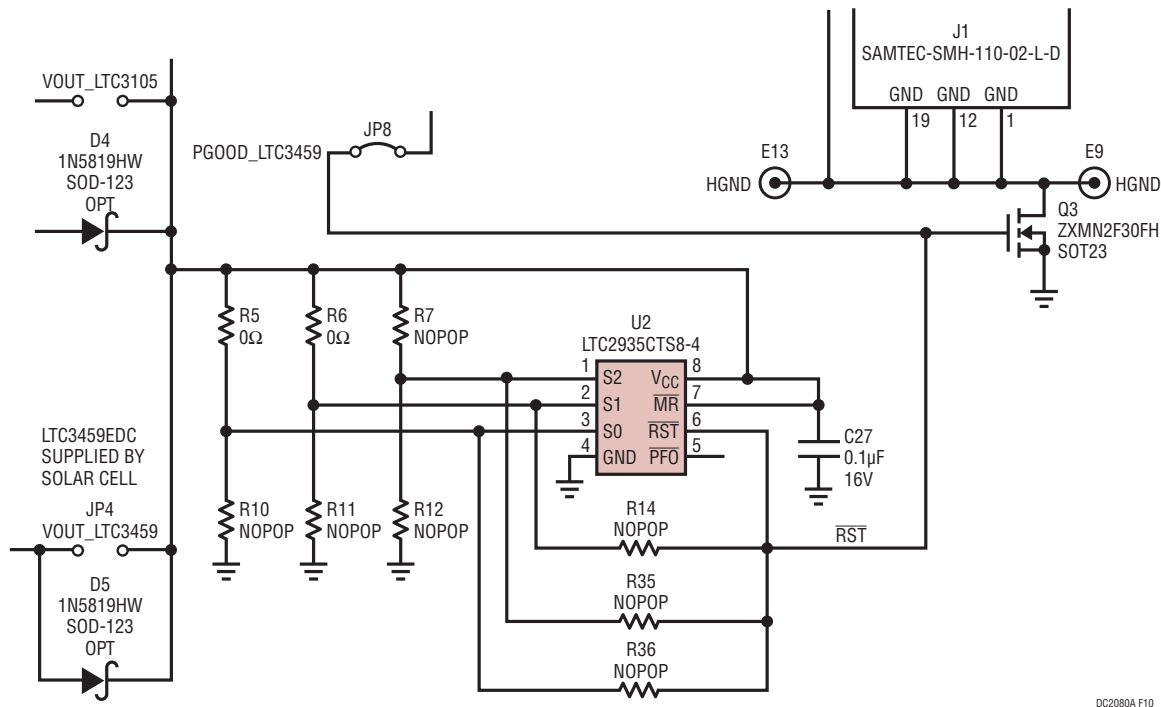

Figure 10. Detailed Schematic of PGOOD_LTC3459 Circuit Using LTC2935-2

The LTC3459 does not have an internally generated PGOOD signal so the LTC2935-2 was used to generate a PGOOD function with an adjustable hysteresis window. The NOPOP and 0Ω resistors around the LTC2935-2 allow for customization of the PGOOD thresholds and hysteresis window. By using R14, R35 and R36 the inputs can be changed after the rising Threshold is reached, creating a large hysteresis window.

The PGOOD_LTC3459 signal can be used in place of any of the PGOOD signals generated by the harvester circuits. The PGOOD_LTC3459 signal is always used to switch the output voltage on the header. The board is configured from the factory to use the PGOOD_LTC3459 signal as the PGOOD signal to switch from battery power to energy harvesting power.

The PGOOD_LTC3459 signal is always used to switch the output voltage on the header. Some loads do not like to see a slowly rising input voltage. Switch Q3 ensures that

VMCU on the header is off until the energy harvested output voltage is high enough to power the load. The LTC2935-2 is configured to turn on Q3 at 3.15V and turn off Q3 at 2.25V. With this circuit, the load will see a fast voltage rise at start-up and be able to utilize all the energy stored in the output capacitors between the 3.15V and 2.25V levels.

Diode D5 is an optional component used to Diode-OR multiple energy harvesting sources together. This diode would be used in conjunction with one or more of the other Or-ing diodes, D2, D3 or D4. When the Or-ing diodes are installed the parallel jumper would not be populated. The diode drop will be subtracted from the output voltage setpoint, so it is recommended to change the feedback resistors or select a higher output voltage setpoint to compensate for the diode drop. When more than one of these diodes is installed and the associated energy harvester inputs are powered, the board will switch between energy harvester power circuits as needed to maintain the output voltage.

5	0	R1 (OPT)	RES, CHIP, 4.99KΩ, ±1%, 1/16W, 0402, ±100ppm/°C	VISHAY, CRCW04024K99FKED
6	0	R2, R7, R9, R10, R11, R12, R14, R15, R18, R31, R32, R33, R36	RES., CHIP, 0402	NOPOP
7	0	R4 (OPT)	RES, CHIP, 50.5kΩ, ±1%, 1/16W, 0402, ±100ppm/°C	VISHAY, CRCW040250K5FKED
8	0	R22 (OPT)	RES, CHIP, 2.80MΩ, ±1%, 1/16W, 0402, ±100ppm/°C	VISHAY, CRCW04022M80FKED

Hardware for Demo Board Only

1	14	E1 - E14	TURRET, 0.061 DIA	MILL-MAX, 2308-2
2	10	JP1 - JP8, JP11, JP12	HEADER, 2 PINS, 2mm	SAMTEC, TMM-102-02-L-S
3	2	JP9, JP10	HEADER, 3 PINS, 2mm	SAMTEC, TMM-103-02-L-S
4	3	JP4, JP9, JP11	SHUNT 2mm	SAMTEC, 2SN-BK-G
5	0	JP1, JP2, JP3, JP5, JP6, JP7, JP8, JP10, JP12	SHUNT 2mm, (DO NOT INSTALL)	SAMTEC, 2SN-BK-G
6	1	J1	HEADER, 2×10, 20-PIN, SMT HORIZONTAL SOCKET, 0.100"	SAMTEC, SMH-110-02-L-D
7	0	J2 (OPT)	HEADER, 2×6, 12-PIN, SMT HORIZONTAL SOCKET WITH KEY, 0.100"	SAMTEC, SMH-106-02-L-D-05
8	1	J3	PIEZO CONNECTOR 4 PIN, TERMINAL BLOCK, WR-TBL	WÜRTH, 691411710002
9	4		ADHESIVE CABLE MOUNT U-STYLE CLIP	WÜRTH, 523252000
10	1		KERAFOL, KL 90 40mm × 40mm × 3mm DOUBLE-SIDED ADHESIVE TAPE	KERATHERM, KL 90 40mm × 40mm × 3mm
11	0.007		DOUBLE-SIDED MOUNTING TAPE, 35mm × 38mm FOR SOLAR CELL	TESA, 55742 (KIT QTY = NUMBER OF REELS, ROUND UP)

DEMO MANUAL DC2080A

DEMONSTRATION BOARD IMPORTANT NOTICE

Linear Technology Corporation (LTC) provides the enclosed product(s) under the following **AS IS** conditions:

This demonstration board (DEMO BOARD) kit being sold or provided by Linear Technology is intended for use for **ENGINEERING DEVELOPMENT OR EVALUATION PURPOSES ONLY** and is not provided by LTC for commercial use. As such, the DEMO BOARD herein may not be complete in terms of required design-, marketing-, and/or manufacturing-related protective considerations, including but not limited to product safety measures typically found in finished commercial goods. As a prototype, this product does not fall within the scope of the European Union directive on electromagnetic compatibility and therefore may or may not meet the technical requirements of the directive, or other regulations.

If this evaluation kit does not meet the specifications recited in the DEMO BOARD manual the kit may be returned within 30 days from the date of delivery for a full refund. THE FOREGOING WARRANTY IS THE EXCLUSIVE WARRANTY MADE BY THE SELLER TO BUYER AND IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED, IMPLIED, OR STATUTORY, INCLUDING ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE. EXCEPT TO THE EXTENT OF THIS INDEMNITY, NEITHER PARTY SHALL BE LIABLE TO THE OTHER FOR ANY INDIRECT, SPECIAL, INCIDENTAL, OR CONSEQUENTIAL DAMAGES.

The user assumes all responsibility and liability for proper and safe handling of the goods. Further, the user releases LTC from all claims arising from the handling or use of the goods. Due to the open construction of the product, it is the user's responsibility to take any and all appropriate precautions with regard to electrostatic discharge. Also be aware that the products herein may not be regulatory compliant or agency certified (FCC, UL, CE, etc.).

No License is granted under any patent right or other intellectual property whatsoever. **LTC assumes no liability for applications assistance, customer product design, software performance, or infringement of patents or any other intellectual property rights of any kind.**

LTC currently services a variety of customers for products around the world, and therefore this transaction **is not exclusive**.

Please read the DEMO BOARD manual prior to handling the product. Persons handling this product must have electronics training and observe good laboratory practice standards. **Common sense is encouraged.**

This notice contains important safety information about temperatures and voltages. For further safety concerns, please contact a LTC application engineer.
